Introduction

- Reducing the CO₂ emissions is paramount to meet the decarbonization goal of net-zero emissions by 2050
 - Post-combustion carbon capture offers a variety of advantages:¹⁻⁴
 - Retrofit to existing coal fired power plants
 - Suitable for natural gas fired power plants
 - Power generation can be achieved even if the carbon capture process is down for maintenance unlike the pre-combustion process
- Chemical absorption is a widely used post-combustion method¹⁻⁴
 - The most common chemical absorbers are amine-based solvents:
 - These solvent systems degrade losing carbon capture efficiency over time
 - Monoethanolamine (MEA) is the most studied
- Objective**
 - In situ real-time monitoring of amine degradation will optimize operational control, carbon capture efficiency, and reduce the overall cost**

State-of-the-Art Monitoring

Physical Parameters

Table 2. Physical monitoring parameters for PSCC²⁻⁶

| Location | Equipment | System Parameter Monitoring |
|----------|----------------------|-----------------------------|
| 1,2,3 | Pressure Gauge | Pressure of Gas and Liquids |
| 1,2 | Volumetric Flow Rate | Rate of Gaseous Flow |
| 4,5,6,7 | Viscosity | Flow Rate of Solvent |
| 4,5,6,7 | Temperature | Temperature of Solvent |

Chemical Parameters

Table 3. Chemical monitoring parameters for PSCC²⁻⁶ and potential equipment cost¹⁰

| Location | Equipment | Chemical Composition Monitoring | Potential Cost |
|----------|---|--|----------------|
| 1 | pH Meter | Basicity | \$3,000 |
| 1 | UV | SO ₂ , NO ₂ | \$10,000 |
| 1 | Total Organic Carbon Analyzer | CO ₂ | \$3,000 |
| 2,5,6 | FTIR | CO ₂ , H ₂ O, NH ₃ , NO, NO ₂ , SO ₂ , CH ₂ O, C ₂ H ₄ O, Amines | \$100,000 |
| 2,5,6 | NDIR | CO ₂ | \$20,000 |
| 2 | Paramagnetic | O ₂ | \$8,000 |
| 3,4 | GC/MS | CO ₂ , O ₂ , N ₂ , H ₂ O | \$100,000 |
| 3,4 | LC/MS | CO ₂ , O ₂ , N ₂ , H ₂ O | \$50,000 |
| 2,4 | Electric Conductivity Single Ion Monitoring | O ₂ content | \$1,000 |
| 5,6 | Electric Low-Pressure Impactor | Aerosol Measurements (Size Distribution and Count) | < \$50,000 |

Monitoring locations for Tables 2 & 3 are indicated in Figure 1.

Technology Gap

- Cost of analysis instrument
- Periodic sampling
- Point sensing
- Sensitivity to low-concentration degradation products
- Lack of monitoring of trace toxic metals

Optical Fiber CO₂ Sensor

Real-Time Monitoring of CO₂ Capture Efficiency

Amine Degradation Mechanisms^{1,5-9}

- Oxidative: absorber, cross exchanger
- Thermal: stripper
- Caused by flue gas contaminants

National Carbon Capture Center (NCCC) Slipstream Solvent Test Unit (SSTU)

Problem Statement: 1) Solvent degradation is hindering large-scale deployment of amine-based carbon capture. Amine solvent degradation associated costs can be significant compared with the cost to monitor. 2) Existing monitoring methods usually involve sampling from the process lines and sending samples to laboratories for analysis using expensive instruments.

Key Parameters for Amine Degradation Monitoring

Direct Monitoring

- Amine Solvent Color Change⁹**
 - Amine degradation leads to color changes
- Amine Concentration in Water^{5,8}**
- pH Change¹¹**
 - Indicates CO₂ loading; CO₂ dissolution into water; heat stable salt neutralization
- Degradation Products Detection⁸**
 - Nitrate, sulfate salts, nitrosamine, ammonia gas

Figure 2. Examples of an amine solvent system degradation over time.⁹

Indirect Monitoring

- Temperature Monitoring⁸**
 - Related to thermal degradation
- O₂ Monitoring**
 - Oxidative: absorber, cross exchanger
 - O₂ concentration: 5-10 ppm in solvents
- Monitoring of Flue Gas Contaminants**
 - SO_x, NO_x, etc.
- Toxic Trace Metal Ion Monitoring**
 - Trace Metals: Hg, As, Se, Cr

Summary

In-situ monitoring with NETL's sensor capabilities has been developed and deployed into the post-combustion carbon capture streams at National Carbon Capture Center (NCCC). These sensors will provide feedback on the carbon capture efficiency, solvent health, and reduce operational costs.

- Developed optical fiber-based sensors for amine degradation and CO₂ monitoring.
- Installed optical fiber-based sensors into the slipstream solvent test unit (SSTU) at NCCC.
- Updated previous CO₂ design to 3D-printed CO₂ sensor for ease of deployment and reduction in sensing volume.
- Revised amine prototype design to improve resistance of ferrules to amine exposure.
- Working on quantitative calibration of amine degradation sensor in the lab.

Next Steps:

- NCCC solvent flow under CO₂ capture conditions will resume, following ongoing repairs to the SSTU solvent line.
- Monitor long-term CO₂ capture performance and solvent degradation.
- Verify optical fiber results against chemical analysis of aliquots and NCCC capture efficiency data.
